

On September XX, The (Air Monitoring Location Name) SGS monitoring device was experiencing connectivity issues. When connectivity of the SGS monitors is not available, the data is stored internally on the SGS monitoring device. When connectivity does become available, the SGS unit begins transmitting the stored data to the database in SGS's cloud database for processing. When a device is experiencing connectivity issues, the data will be manually downloaded and report will be generated at a later time.

On September XX, The (Air Monitoring Location Name) SGS monitoring device was not yet set up, therefore there is no data for this report.
